COVID-19 in Skilled Nursing & Long Term Care Facilities

Jacob Walker, MD
Geriatrics Fellow, Geriatric and Palliative Medicine

Katherine Thompson, MD
Associate Professor of Medicine, Geriatric and Palliative Medicine

Kimberly Beiting, MD
Geriatrics Fellow, Geriatric and Palliative Medicine

Lauren Gleason, MD, MPH
Assistant Professor of Medicine, Geriatric and Palliative Medicine

Monica Long, BSN, RN
Clinical Nurse Educator, Geriatric and Palliative Medicine

Saira Shervani, MD
Geriatrics Fellow, Geriatric and Palliative Medicine

Stacie Levine, MD
Professor of Medicine, Geriatric and Palliative Medicine

Stephen Shrantz, MD
Assistant Professor of Medicine, Infectious Diseases
COVID19 in the Nursing Home: Admitting and Isolation

Kimberly Beiting MD
Geriatrics Fellow, University of Chicago – Geriatrics and Palliative Medicine
May 1st 2020
Objectives

- Review the COVID-19 testing landscape and pitfalls
- Explore the nuances of accepting COVID-19 positive patients into the nursing home.
- Discuss the limits of symptom-based screening in a nursing home setting
- Discuss methods of patient isolation in the SNF
- Define line listing as a public health and clinical tool.
- Explore guidelines for communicating with public health department
Disclosures

- I have no disclosures to report.
COVID-19 Testing Landscape and Pitfalls
Testing Landscape

PRIORITIES FOR COVID-19 TESTING
(Nucleic Acid or Antigen)

High Priority

- Hospitalized patients
- Healthcare facility workers, workers in congregate living settings, and first responders with symptoms
- Residents in long-term care facilities or other congregate living settings, including prisons and shelters, with symptoms
- Persons identified through public health cluster and selected contact investigations

Priority

- Persons with symptoms of potential COVID-19 infection, including: fever, cough, shortness of breath, chills, muscle pain, new loss of taste or smell, vomiting or diarrhea and/or sore throat
- Persons without symptoms who are prioritized by health departments or clinicians, for any reason, including but not limited to: public health monitoring, sentinel surveillance, or screening of other asymptomatic individuals according to state and local plans.

Testing Landscape

- Laboratory access
- Testing supplies access
- Test result turn-around time
Testing Pitfalls

- Molecular diagnostic assays, such as PCR, are used to detect COVID-19
- Sensitivity and specificity of current tests is developing but unclear
- False negative rate may be associated with time between symptom onset and date of test
Testing Pitfalls

- Test results depend on optimal specimen collection (NP swab)
- Staffing needed to adequately test (2 people minimum)

Accepting COVID-19+ Patients
Accepting COVID-19+ patients

The disease caused by the virus has killed more than 10,500 residents and staff members at nursing homes and long-term care facilities nationwide, according to a New York Times analysis. That is nearly a quarter of deaths in the United States from the pandemic. On Saturday, Gov. Andrew M. Cuomo of New York described nursing homes as a “feeding frenzy for this virus.”

At the epicenter of the outbreak, New York issued a strict new rule last month: Nursing homes must readmit residents sent to hospitals with the coronavirus and accept new patients as long as they are deemed “medically stable.” California and New Jersey have also said that nursing homes should take in such patients.
Accepting COVID19+ patients

Los Angeles Times

Dr. Michael Wasserman, a geriatrician for more than 30 years and president of the California Assn. of Long Term Care Medicine, has been lobbying California regulators not to force homes to take in people unless they are proven virus-free. Doing otherwise, he said, is “akin to premeditated murder.”

Accepting COVID19+ patients

- COVID19 naïve facilities
- COVID19 exposed facilities
Accepting COVID19+ patients

- Considerations:
  - Increased patient care requirements
  - Nursing capacity
  - Decreased staffing ratios (illness, quarantine)
  - Facility resources/availability (O2 tanks, IVF, PPE)
  - Presence of physicians/APPs
### COVID-19 IDPH Interim Guidance: Accepting Transfers from Acute Care Settings to LTCF

Limits of Symptom Based Screening in a Nursing Home
Symptom-based screening

- Per IDPH guidelines, all residents should be screened with vital signs including temperature, heart rate, respirations AND pulse oximetry every 8 hours (q8 hours). COVID+ patients should get vitals checked q4 hours.

- Clinical supervisor should be contacted for new-onset fever (>100.0), SOB, cough, sore throat or for any decrease in pulse oximetry from resident baseline level or any pulse oximetry reading < 92%.

Updates to COVID-19 Symptoms

- Cough
- Shortness of breath or difficulty breathing

Or at least two of these symptoms:
- Fever
- Chills
- Repeated shaking with chills
- Muscle pain
- Headache
- Sore throat
- New loss of taste or smell

Limits of Symptom Based Screening

- Confounding variables:
  - Cognitive impairment
  - Hx of CVA/Aphasia
  - Reliability of equipment (pulse oximetry)
  - Definition of fever
  - Asking the right questions
Asymptomatic/presymptomatic COVID+

- Symptom based screening leaves out a whole cohort of patients who either may not be able to report symptoms, are presymptomatic, or are truly asymptomatic.
Methods of Patient Isolation
Methods of isolation

- Cohorting by wing
- Cohorting by floor
- Cohorting by test result
- Cohorting by PUI
- Cohorting by room
- Cohorting by true negative “pure as the driven snow”
Pitfalls of isolation

- Isolating patients takes time and staffing
- Factors that need consideration:
  - Transport/containing personal belongings
  - Room sterilization
- Patient disorientation
Line Listing
Line listing

- Line listing is a method to categorize and standardize investigations of outbreaks of unexplained respiratory illness.
- Upon notification of a potential cluster or outbreak, a line list can be used to collect and organize preliminary information on cases.

Communicating with the Public Health Department
Communicating with IDPH

- Healthcare providers and laboratories are required by the Control of Communicable Disease code to report COVID-19 cases and outbreaks to the local health department.

- Clusters of 2 or more suspect cases of COVID-19 among residents of congregate settings that serve vulnerable populations should be reported to the local health department as soon as possible but within 24 hours.

- When COVID-19 is suspected to be or known (laboratory-confirmed case) to be the cause of death in an individual, this should be reported to the local health department.

Questions?
